IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

Authorization for this examiner's amendment was given in a telephone interview with Cathrine Kinslow on 04/01/2008.

In the specification of page 1,

The specification has been amended as follows:

CROSS REFERENCE TO RELATED APPLICATION

The present invention is related to the following application entitled "Method for Multidimensional Visual Correlation of Systems Management Data", serial no.

[[____]] 10/753250, attorney docket no. AUS920030930USI, filed on
[[____]] 01/08/2004. The above related application is assigned to the same assignee, and incorporated herein by reference.

Allowable Subject Matter

2. Claim 1 is allowed.
3. The following is an examiner's statement of reasons for allowance:

The present invention is directed towards:

A computer implemented method for monitoring system performance and communicating acceptable parameters of system operation via an enhanced graphical user interface, comprising:

obtaining system performance data at set intervals according to a system configuration to determine a current performance status of a system;

determining a type of display graphic for the system performance data;

calculating service level agreement boundaries of acceptable system operation using contractual data in a service level agreement for the type of display graphic, wherein the service level agreement boundaries represent the service level agreement at a current time, and wherein the service level agreement boundaries change according to predefined time periods specified the service level agreement;

updating system performance status markers, which indicate system performance at particular points in time, based on the current performance status of the system;

displaying the updated system performance status markers and the service level agreement boundaries of acceptable system operation within a target-type management vector display having a vertical axis and horizontal axis, wherein the target-type management vector display includes regions representing levels of system performance, wherein a target performance state of the system is a point where the vertical axis and horizontal axis meet on the target-type management vector display, wherein positions of the system status performance markers reflect system

Art Unit: 2146

performance at particular points in time, and wherein a position of a current system performance status marker in relation to the service level agreement boundaries indicates whether current system performance adheres to the service level agreement; responsive to a determination that the current system performance does not adhere to the service level agreement, determining if the current system performance status marker is located outside of a current orchestration action threshold; and responsive to a determination that the current system performance status marker is located outside of a current orchestration action threshold, autonomically reallocating system resources to adjust the current system performance to the target performance state of the system.

The independent claim identifies the unique features that the closest prior art reference, Caccavale, fails to teach. Caccavale does not disclose calculating service level agreement boundaries of acceptable system operation using contractual data in a service level agreement for the type of display graphic, wherein the service level agreement boundaries represent the service level agreement at a current time, and wherein the service level agreement boundaries change according to predefined time periods specified the service level agreement; displaying the updated system performance status markers and the service level agreement boundaries of acceptable system operation within a target-type management vector display having a vertical axis and horizontal axis, wherein the target-type management vector display includes regions representing levels of system performance, wherein a target performance state

of the system is a point where the vertical axis and horizontal axis meet on the target-type management vector display, wherein positions of the system status performance markers reflect system performance at particular points in time, and wherein a position of a current system performance status marker in relation to the service level agreement boundaries indicates whether current system performance adheres to the service level agreement; and responsive to a determination that the current system performance status marker is located outside of a current orchestration action threshold, autonomically reallocating system resources to adjust the current system performance to the target performance state of the system. Singularly, Caccavale fails to anticipate the above limitations.

Caccavale discloses a method and system for dynamically improving the performance of a server in a network where a tuning system monitors: a workload of the server in real time; a set of internal performance characteristics of the server in real time; and a set of adjustable server parameters of the server in real time. Caccavale also discloses a tuning system that periodically alters one or more of the set of adjustable server parameters as a function of the workload and internal performance characteristics of the server. Since the tuning system is continuously monitoring workload and performance characteristics of the server and altering the server parameters accordingly, the effectiveness of a given change in the server parameters is reflected in the next set of monitored workload and performance values.
